

WHAT IS CLAIMED IS:

1. An image display apparatus comprising:  
at least one image forming element; and  
an illumination optical system for illuminating  
5 said image forming element with light from a light  
source,  
wherein an image is formed through modulation of said  
light by said image forming element, and said  
illumination optical system can vary a light intensity  
10 distribution of said light on said image forming  
element.

lens  
array/s

353/01  
movable  
lens

intensity

2. An apparatus according to claim 1, wherein  
said apparatus can supply a plurality of different  
15 distributions as the light intensity distribution of  
said light on said image forming element.

3. An apparatus according to claim 1, wherein  
said apparatus can vary the light intensity  
20 distribution of said light in an effective region of  
said image forming element.

4. An apparatus according to claim 1, wherein:  
said illumination optical system has a secondary  
25 light source forming member for forming a plurality of  
secondary light sources; and

when said image forming element is illuminated

112  
353/38

No primary

light source or light beam?

1000-1515  
with a plurality of light beams from said plurality of  
secondary light sources, projection magnifications of a  
part or all of said plurality of light beams to said  
image forming element are changed so as to make  
5 switchable the relationship of the number of  
overlapping light beams in a central portion of said  
image forming element and the number of overlapping  
light beams in a peripheral portion of said image  
forming element between different and the same, thereby  
10 varying the light intensity distribution in an  
effective region of said image forming element.

5. An apparatus according to claim 1, wherein:  
said illumination optical system has a secondary  
15 light source forming member for forming a plurality of  
secondary light sources; and

when said image forming element is illuminated  
with a plurality of light beams from said plurality of  
secondary light sources, the number of overlapping  
20 light beams in a central portion of said image forming  
element is structured to be larger than the number of  
overlapping light beams in a peripheral portion of said  
image forming element, and projection magnifications of  
said plurality of light beams to said image forming  
25 element are changed, thereby varying the light  
intensity distribution in an effective region of said  
image forming element.

ditto

6. An apparatus according to claim 5, wherein  
said illumination optical system comprises a light  
condensing optical element and varies said distribution  
by moving said light condensing optical element in a  
5 direction of an optical axis. //

7. An apparatus according to any one of claims 1,  
4, and 5, wherein said illumination optical system  
comprises at least one lens array as a secondary light  
10 source forming member for forming a plurality of  
secondary light sources, and varies said distribution  
by moving at least a part of said at least one lens  
array. *cube whole*

8. An apparatus according to claim 7, wherein  
said illumination optical system varies said  
15 distribution by moving at least a part of said at least  
one lens array in a direction of an optical axis.

9. An apparatus according to claim 7, wherein  
said illumination optical system varies said  
20 distribution by moving at least a part of said at least  
one lens array in a direction perpendicular to an  
optical axis.

10. An apparatus according to claim 7, wherein  
said illumination optical system varies said  
25

distribution by rotating at least a part of said at least one lens array.

11. An image display apparatus comprising:  
5 at least one image forming element; and  
an illumination optical system for illuminating said image forming element with light from a light source,

10 wherein an image is formed through modulation of said light by said image forming element, and said illumination optical system can vary an illumination distribution in an effective region of said image forming element.

15 12. An apparatus according to claim 11, wherein said apparatus can supply a plurality of different distributions as said distribution.

20 13. An apparatus according to claim 11, wherein: said illumination optical system has a secondary light source forming member for forming a plurality of secondary light sources; and

25 when said image forming element is illuminated with a plurality of light beams from said plurality of secondary light sources, projection magnifications of a part or all of said plurality of light beams to said image forming element are changed so as to make

112

switchable the relationship of the number of  
overlapping light beams in a central portion of said  
image forming element and the number of overlapping  
light beams in a peripheral portion of said image  
5 forming element between different and the same, thereby  
varying said distribution.

14. An apparatus according to claim 11, wherein:  
said illumination optical system has a secondary  
10 light source forming member for forming a plurality of  
secondary light sources; and  
when said image forming element is illuminated  
with a plurality of light beams from said plurality of  
secondary light sources, the number of overlapping  
15 light beams in a central portion of said image forming  
element is structured to be larger than the number of  
overlapping light beams in a peripheral portion of said  
image forming element, and projection magnifications of  
said plurality of light beams to said image forming  
20 element are changed, thereby varying said distribution.

15. An apparatus according to claim 14, wherein  
said illumination optical system comprises a light  
condensing optical element and varies said distribution  
25 by moving said light condensing optical element in a  
direction of an optical axis.

16. An apparatus according to any one of claims 11, 13, and 14, wherein said illumination optical system comprises at least one lens array as a secondary light source forming member for forming a plurality of secondary light sources, and varies said distribution by moving at least a part of said at least one lens array.

17. An apparatus according to claim 16, wherein said illumination optical system varies said distribution by moving at least a part of said at least one lens array in a direction of an optical axis.

18. An apparatus according to claim 16, wherein said illumination optical system varies said distribution by moving at least a part of said at least one lens array in a direction perpendicular to an optical axis.

19. An apparatus according to claim 16, wherein said illumination optical system varies said distribution by rotating at least a part of said at least one lens array.

20. An apparatus according to claim 1 or 11, further comprising:

a projection optical system for projecting an

image formed by said image forming element on a  
projection surface, wherein said apparatus includes a  
plurality of image forming elements, and said  
projection optical system overlappingly projects on  
5 said projection surface images formed by said plurality  
of image forming elements.

21. An apparatus according to claim 20, wherein  
said image forming elements are for red, green, and  
10 blue, respectively and said apparatus further comprises  
a plurality of dichroic mirrors for combining colors  
from said image forming elements.

22. An apparatus according to claim 20, wherein  
15 said image forming elements are for red, green, and  
blue, respectively and said apparatus further comprises  
a plurality of dichroic prisms for combining colors  
from said image forming elements.

20 23. An image display system comprising:  
an apparatus according to claim 1 or 11; and  
an image recording apparatus for supplying an  
image signal to said apparatus according to claim 1 or  
11.

112<sup>7</sup>

25

24. An image display system comprising:  
an apparatus according to claim 1 or 11; and

a computer for supplying an image signal to said apparatus.

25. An illumination system comprising:

5 a secondary light source forming member for forming a plurality of secondary light sources from light from a light source, wherein an illumination surface is illuminated with a plurality of light beams from said plurality of secondary light sources, and projection magnifications  
10 of a part or all of said plurality of light beams to said illuminated surface are changed, thereby varying an illumination distribution on said illuminated surface.

15

26. An illumination system according to claim 25, wherein said distribution is varied by switching the relationship of the number of overlapping light beams in a central portion of said illuminated surface and  
20 the number of overlapping light beams in a peripheral portion of said illuminated surface between different and the same.

27. An illumination system according to claim 25,  
25 wherein the number of overlapping light beams in a central portion of said illuminated surface is structured to be larger than the number of overlapping

light beams in a peripheral portion of said illuminated surface, and projection magnifications of said plurality of light beams to said illuminated surface are changed, thereby varying said distribution in an effective region of said illuminated surface.

28. An illumination system according to claim 25, comprising:

at least one lens array as said secondary light source forming member; and  
a light condensing optical element,  
wherein said distribution is varied by moving said light condensing optical element in a direction of an optical axis.

29. An illumination system according to claim 27, comprising:

at least one lens array as said secondary light source forming member; and  
a light condensing optical element,  
wherein said distribution is varied by moving said light condensing optical element in a direction of an optical axis.

30. An illumination system according to claim 25, comprising:

at least one lens array as said secondary light

source forming member; and

a light condensing optical element,  
wherein said distribution is varied by moving at least  
a part of said at least one lens array.

5

31. An illumination system according to claim 30,  
wherein said distribution is varied by moving at least  
a part of said at least one lens array in a direction  
of an optical axis.

10

32. An illumination system according to claim 30,  
wherein said distribution is varied by moving at least  
a part of said at least one lens array in a direction  
perpendicular to an optical axis.

15

33. An illumination system according to claim 30,  
wherein said distribution is varied by rotating at  
least a part of said at least one lens array.

20

34. An illumination system according to claim 26,  
comprising:

at least one lens array as said secondary light  
source forming member; and

25

a light condensing optical element,  
wherein said distribution is varied by moving at least  
a part of said at least one lens array.

35. An illumination system according to claim 34, wherein said distribution is varied by moving at least a part of said at least one lens array in a direction of an optical axis.

5

36. An illumination system according to claim 34, wherein said distribution is varied by moving at least a part of said at least one lens array in a direction perpendicular to an optical axis.

10

37. An illumination system according to claim 34, wherein said distribution is varied by rotating at least a part of said at least one lens array.

15

38. An illumination system comprising:

a secondary light source forming member for forming a plurality of secondary light sources from light from a light source, wherein an illuminated surface is illuminated with a plurality of light beams from said plurality of secondary light sources, and projection magnifications of a part or all of said plurality of light beams to said illuminated surface are changed, thereby varying an illumination distribution in an effective region of said illuminated surface.

20

25

39. An illumination system according to claim 38,

wherein said distribution is varied by switching the relationship of the number of overlapping light beams in a central portion of said illuminated surface and the number of overlapping light beams in a peripheral portion of said illuminated surface between different and the same.

40. An illumination system according to claim 38, wherein the number of overlapping light beams in a central portion of said illuminated surface is structured to be larger than the number of overlapping light beams in a peripheral portion of said illuminated surface, and projection magnifications of said plurality of light beams to said illuminated surface are changed, thereby varying said distribution.

41. An illumination system according to claim 38, comprising:

at least one lens array as said secondary light source forming member; and

a light condensing optical element, wherein said distribution is varied by moving said light condensing optical element in a direction of an optical axis.

25

42. An illumination system according to claim 40, comprising:

at least one lens array as said secondary light source forming member; and

a light condensing optical element,

wherein said distribution is varied by moving said

5 light condensing optical element in a direction of an optical axis.

43. An illumination system according to claim 38, comprising:

10 at least one lens array as said secondary light source forming member; and

a light condensing optical element,

wherein said distribution is varied by moving at least a part of said at least one lens array.

15

44. An illumination system according to claim 43, wherein said distribution is varied by moving at least a part of said at least one lens array in a direction of an optical axis.

20

45. An illumination system according to claim 43, wherein said distribution is varied by moving at least a part of said at least one lens array in a direction perpendicular to an optical axis.

25

46. An illumination system according to claim 43, wherein said distribution is varied by rotating at

least a part of said at least one lens array.

47. An illumination system according to claim 39,  
comprising:

5       at least one lens array as said secondary light  
source forming member; and

          a light condensing optical element,  
wherein said distribution is varied by moving at least  
a part of said at least one lens array.

10

48. An illumination system according to claim 47,  
wherein said distribution is varied by moving at least  
a part of said at least one lens array in a direction  
of an optical axis.

15

49. An illumination system according to claim 47,  
wherein said distribution is varied by moving at least  
a part of said at least one lens array in a direction  
perpendicular to an optical axis.

20

50. An illumination system according to claim 47,  
wherein said distribution is varied by rotating at  
least a part of said at least one lens array.

25

51. An image display apparatus comprising:  
at least one image forming element; and  
an illumination system according to claim 25 or 38

for illuminating said at least one image forming element with light from a light source.

52. An apparatus according to claim 51, further comprising:

5 a projection optical system for projecting an image formed by said image forming element on a projection surface, wherein said apparatus further comprises a plurality of image forming elements and  
10 said projection optical system overlappingly projects on said projection surface images formed by said plurality of image forming elements.

53. An apparatus according to claim 51, wherein  
15 said plurality of image forming elements are for red, green, and blue, respectively and said apparatus further comprises a plurality of dichroic mirrors for combining colors from said image forming elements.

20 54. An apparatus according to claim 51, wherein said plurality of image forming elements are for red, green, and blue, respectively and said apparatus further comprises a plurality of dichroic prisms for combining colors from said image forming elements.

25

55. An image display system comprising:  
an apparatus according to claim 51; and

an image recording apparatus for supplying an image signal to said apparatus.

56. An image display system comprising:

5 an apparatus according to claim 51; and  
a computer for supplying an image signal to said apparatus.

57. An apparatus according to claim 1 or 11  
10 further comprising a projection optical system for projecting an image formed by said image forming element on a projection surface, wherein said apparatus has a single image forming element and said projection optical system projects the image formed by said single  
15 image forming element on the projection surface.

58. An apparatus according to claim 51 further comprising a projection optical system for projecting an image formed by said image forming element on a  
20 projection surface, wherein said apparatus has a single image forming element and said projection optical system projects the image formed by said single image forming element on the projection surface.
